

The Top Developer Trends in 2025?

1. Return to simplicity

- Vanilla code - less frameworks
- JQuery (was cool, then it started hanging out with PHP ...) The disco of the front-end development world.
- PHP - designed for server side web development. It shows.
- Simple hosting (shared, private VPS) - not AWS and Azure
- Simple architecture - virtualization is out!
- Simple dev ops
- Code purity is for losers ... people who want to make money concentrate on results: unit test, super optimizations.

2. Freelance and SAAS business building ... rather than getting a job!

- Big companies are laying off (for now,) to cut cost.
- Hundreds of interviews and no results.
- Freelance is empowering.
- Freelancing is flexible.
- SAAS is the ultimate expression of nerd power: it's freakin' hard, but man, when it works ... you are king-nerd!
